

DEFACEMENT MONITOR

Protect your Web site and your reputation from defacement

Is your site protected against hackers who can deface your Web site's pages with offensive graphics and text? It's a problem that's on the rise. But most businesses and hosting firms do not manage this critical threat. If a hacker defaces your site, customers will seek a competitor with a more secure Web site.

The Defacement Monitor from Catbird Networks™ is the only product that monitors your Web content for unauthorized changes. The Defacement Monitor establishes "baseline content" — approved content for your Web site — and compares it to your live site every 2 minutes, every day. If a mismatch occurs, Catbird Networks will immediately alert you via email or pager so you can address the problem before your customers notice.

Benefits of Catbird Defacement Monitor

- Secure your reputation against defacement — Most businesses and hosters don't monitor for defacement even if their security program is robust. Not doing so leaves their sites exposed — which can negatively impact their reputation and revenue.
- Minimize exposure through early detection — If defacement occurs, Catbird Networks notifies you immediately via pager or email.
- Protect your site from graffiti and malicious code — What you can't see can be even more dangerous. The Defacement Monitor watches your site for both graffiti attacks and unseen malicious code.
- Flexible set-up allows for dynamic sites — To eliminate false notifications, you can program the Defacement Monitor to ignore authorized content that changes regularly.
- Set up your test quickly and easily — Simply log on to our secure Web site and identify baseline content so the Defacement Monitor can begin monitoring your site.
- Automatically monitor your site all day, every day — We typically monitor every two minutes so you're informed as soon as an event occurs.
- Monitor server security from all over the Internet — Catbird monitors your servers from major points on the Internet and outside your firewall. Which means there is no software to install or integrate within your network.
- Better management with automatic reporting options — Multiple report options provide the right information for the right audience. Reports are sent automatically and on-demand.
